RESUBMISSION OF APPEAL BRIEF

Dear Sir:

In response to the Notification of Non-Compliant Appeal Brief mailed August 14, 2006, the Appellant resubmits herewith a substitute Appeal Brief believed to comply with the requirements of the Order Returning Undocketed Appeal to Examiner mailed June 29, 2006. Entry thereof is respectfully requested.

Respectfully submitted,

I. REAL PARTY IN INTEREST (37 C.F.R. § 41.37(c)(1)(i))

The real party in interest in this appeal is ViXS Systems, Inc.

II. RELATED APPEALS AND INTERFERENCES (37 C.F.R. § 41.37(c)(1)(ii))

There are no interferences or other appeals that will directly affect, or be directly affected by, or have a bearing on the Board's decision in this appeal.

III. STATUS OF CLAIMS (37 C.F.R. § 41.37(c)(1)(iii))**A. TOTAL NUMBER OF CLAIMS IN APPLICATION**

There are sixty-two (62) claims pending in the application (claims 1-4, 6-13, 15-20, 22-58, 60, 61, 63-65, 67 and 68).

B. STATUS OF ALL THE CLAIMS**1. Claims pending:**

Claims 1-4, 6-13, 15-20, 22-58, 60, 61, 63-65, 67 and 68.

2. Claims withdrawn from consideration but not canceled:

Claims 22-56.

3. Claims allowed:

NONE.

4. Claims objected to:

NONE.

5. Claims rejected:

Claims 1-4, 6-13, 15-20, 57, 58, 60, 61, 63-65, 67 and 68 are rejected under 35 U.S.C. § 103.

6. Claims canceled:

Claims 5, 14, 21, 59, 62 and 66.

C. CLAIMS ON APPEAL

There are twenty-seven (27) claims on appeal, claims 1-4, 6-13, 15-20, 57, 58, 60, 61, 63-65, 67 and 68.

IV. STATUS OF AMENDMENTS (37 C.F.R. § 41.37(c)(1)(iv))

In the response to the Final Office Action dated March 10, 2004, claim amendments were submitted. The proposed claim amendments were submitted to overcome informalities associated with the claims and not to change the scope of the recited invention. In the Advisory Action mailed May 25, 2004, the box associated with Item 7b of the PTO form has been checked, thereby indicating that the proposed amendments have been entered.

V. SUMMARY OF THE CLAIMED SUBJECT MATTER (37 C.F.R. § 41.37(c)(1)(v))

The following summary is provided to give the Board the ability to quickly determine where the claimed subject matter appealed herein is described in the present application and is not to limit the scope of the claimed invention.

The subject matter of independent claim 1 is directed to a system. Claim 1 recites the features of a video decoder (e.g., MPEG decoder 110, FIG. 1) to receive a video input stream having one or more first motion vectors. The video decoder (e.g., MPEG decoder 110, FIG. 1) is to provide decoded video and the first motion vectors associated with the video input stream (e.g., p. 1, lines 4-8). Claim 1 further recites the features of a first memory coupled to the video decoder to store the first motion vectors (e.g., memory 140, FIG. 1), and a scaler coupled to receive the decoded video and to provide a scaled video (e.g., block 390, FIG. 2, and p. 5, lines

6-8). Claim 1 additionally recites the features of an encoder (e.g., MPEG encoder 150, FIG. 1) coupled to the scaler and the first memory (e.g., memory 140, FIG. 1) to provide a compressed representation of the scaled video using the first motion vectors saved in the first memory (e.g., blocks 440, 450, 460, 480, 485, 488, and 490, FIG. 2).

The subject matter of independent claim 11 is directed to a method. Claim 11 recites the features of determining a plurality of first motion vectors associated with a compressed first video image and storing the plurality of first motion vectors (a stored plurality of first motion vectors) (e.g., blocks 360 and 370, FIG. 2, and p. 5, lines 9-11 and p. 6, lines 14-15). Claim 11 further recites the features of generating one or more second motion vectors based on the stored plurality of first motion vectors (e.g., blocks 440 and 450, FIG. 2, and p. 5, line 18 – p. 6., line 2), and generating a compressed second video image based upon one or more second motion vectors, wherein the second video image is a scaled representation of the first video image (e.g., blocks 460, 480, 485, 488, and 490, and p. 6, lines 3-20).

VI. GROUNDS OF REJECTION TO BE REVIEWED ON APPEAL (37 C.F.R. § 41.37(c)(1)(vi))

A. Claims 1-4, 6, 10-13, 60, 62, 63, 67 and 68 are rejected under 35 U.S.C. § 103 as unpatentable over United States Patent No. 5,635,985 to *Boyce et al* (hereinafter, "the *Boyce* reference") in view of United States Patent No. 6,005,623 to *Takahashi et al* (hereinafter, "the *Takahashi* reference") as set forth in the Final Office Action dated March 10, 2004 (hereinafter, "the Final Action") and the subsequent Advisory Action dated May 25, 2004 (hereinafter, "the Advisory Action").

B. Claims 7, 8, 15, 17, 19 and 20 are rejected under 35 U.S.C. § 103 as unpatentable over the *Boyce* reference in view of the *Takahashi* reference and further in view of United States

Patent No. 6,005,624 to *Video Transcoding By Reducing Spatial Resolution* (hereinafter, “the *Yin* reference”) as set forth in the Final Action and the subsequent Advisory Action.

C. Claims 9, 16 and 18 are rejected under 35 U.S.C. § 103 as unpatentable over the *Boyce* reference in view of the *Takahashi* reference and further in view of United States Patent No. 6,005,624 to *Samad et al* (hereinafter, “the *Samad* reference”) as set forth in the Final Action and the subsequent Advisory Action.

D. Claims 57, 58, 64 and 65 are rejected under 35 U.S.C. § 103 as unpatentable over the *Boyce* reference in view of the *Takahashi* reference and further in view of United States Patent No. 6,005,624 to *Vainsencher* (hereinafter, “the *Vainsencher* reference”) as set forth in the Final Action and the subsequent Advisory Action.

E. Claim 61 is rejected under 35 U.S.C. § 103 as unpatentable over the *Boyce* reference in view of the *Takahashi* reference and further in view of United States Patent No. 6,005,624 to *Mogeat et al* (hereinafter, “the *Samad* reference”) as set forth in the Final Action and the subsequent Advisory Action.

F. Claim 10 is rejected under 35 U.S.C. § 112, second paragraph, as being indefinite as set forth in the Final Action and the subsequent Advisory Action.

VII. ARGUMENTS (37 C.F.R. § 41.37(c)(1)(vii))

Based on the arguments and issues below, none of the claims stand or fall together, because in addition to having different scopes, each of the independent claims has a unique set of issues relating to its rejection and appeal as indicated in the arguments below:

A. Rejection of Claims 1-4, 6, 10-13, 60, 62, 63, 67 and 68 under 35 U.S.C. § 103 (37 C.F.R. §1.192(c)(8)(iv)):

In Section 5 of the Final Action, claims 1-4, 6, 10-13, 60, 62, 63, 67 and 68 were rejected under 35 U.S.C. § 103(a) as unpatentable over the *Boyce* reference in view of the *Takahashi* reference. Claims 1 and 11, from which claims 2-4, 6, 10, 12, 13, 60, 62, 63, 67 and 68 respectively depend, are reproduced below for ease of reference.

1. (Previously Presented) A system comprising:

a video decoder to receive a video input stream having one or more first motion vectors, the video decoder to provide decoded video and the first motion vectors associated with the video input stream;
a first memory coupled to the video decoder to store the first motion vectors;
a scaler coupled to receive the decoded video and to provide a scaled video; and
an encoder coupled to the scaler and the first memory to provide a compressed representation of the scaled video using the first motion vectors saved in the first memory.

11. (Previously Presented) A method comprising:

determining a plurality of first motion vectors associated with a compressed first video image;
storing the plurality of first motion vectors (a stored plurality of first motion vectors);
generating one or more second motion vectors based on the stored plurality of first motion vectors; and

generating a compressed second video image based upon one or more second motion vectors, wherein the second video image is a scaled representation of the first video image.

According to 35 U.S.C. § 103(a), "[a] patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art of such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains."

In *ex parte* examination of patent applications, the Patent Office bears the burden of establishing a *prima facie* case of obviousness. *In re Fritch*, 972 F.2d 1260, 1262, 23 U.S.P.Q. 2d 1780, 1783 (Fed. Cir. 1992). The initial burden of establishing a *prima facie* basis to deny patentability to a claimed invention is always upon the Patent Office. *In re Oetiker*, 977 F.2d 1443, 1445, 24 U.S.P.Q.2d 1443, 1444 (Fed. Cir. 1992); *In re Piasecki*, 745 F.2d 1468, 1472, 223 U.S.P.Q. 785, 788 (Fed. Cir. 1984). Only when a *prima facie* case of obviousness is established does the burden shift to the applicant to produce evidence of nonobviousness. *In re Oetiker*, 977 F.2d 1443, 1445, 24 U.S.P.Q.2d 1443, 1444 (Fed. Cir. 1992); *In re Rijckaert*, 9 F.3d 1531, 1532, 28 U.S.P.Q.2d 1955, 1956 (Fed. Cir. 1993). If the Patent Office does not produce a *prima facie* case of unpatentability, then without more the applicant is entitled to grant of a patent. *In re Oetiker*, 977 F.2d 1443, 1445, 24 U.S.P.Q.2d 1443, 1444 (Fed. Cir. 1992); *In re Grabiak*, 769 F.2d 729, 733, 226 U.S.P.Q. 870, 873 (Fed. Cir. 1985).

A *prima facie* case of obviousness is established when the teachings of the prior art itself suggest the claimed subject matter to a person of ordinary skill in the art. *In re Bell*, 991 F.2d 781, 783, 26 U.S.P.Q.2d 1529, 1531 (Fed. Cir. 1993). To establish a *prima facie* case of

obviousness, three basic criteria must be met. First, there must be some suggestion or motivation, either in the references themselves or in the knowledge generally available to one of ordinary skill in the art, to modify the reference or to combine reference teachings. Second, there must be a reasonable expectation of success. Finally, the prior art reference (or references when combined) must teach or suggest all the claim limitations. The teaching or suggestion to make the claimed invention and the reasonable expectation of success must both be found in the prior art, and not based on applicant's disclosure.

The Final Action asserts that the proposed combination of the *Boyce* reference and the *Takahashi* reference disclose the claimed invention as recited by claims 1-4, 6, 10-13, 60, 62, 63, 67 and 68. The Appellant disagrees and submits that the proposed combination of the *Boyce* reference and the *Takahashi* reference fails to disclose or suggest each and every limitation recited by claims 1-4, 6, 10-13, 60, 62, 63, 67 and 68. Furthermore, the Appellant submits that there is no motivation to combine the *Boyce* reference and the *Takahashi* reference as proposed in the Final Action.

1) The *Boyce* Reference Fails to Disclose Storing Motion Vectors

Claim 1 recites, in part, the limitations of a video decoder to provide first motion vectors associated with a video input stream, a first memory coupled to the video decoder to store the first motion vectors, and an encoder coupled to the first memory to provide a compressed representation of scaled video data using the first motion vectors saved in the memory. The Appellant submits that the *Boyce* reference fails to disclose or suggest a first memory coupled to a video decoder and an encoder for the storage of motion vectors provided by the video coder for subsequent use by the encoder as recited in claim 1.

storage of motion vectors in either of the coded data buffer 116 or the frame buffer 118. As disclosed by the *Boyce* reference, a preparser 112 is coupled to the coded data buffer 116, where “the preparser 112 operates to reduce the amount of HDTV data supplied to the coded data buffer [116]. It does this by selectively discarding some of the received HDTV data. By using the preparser 112 to parse and discard data prior to variable length decoding it is possible to operate the preparser 112 at a data rate that is a function of the data rate of the received bitstream.” *Boyce*, col. 5, line 63 – col. 6, line 2. The *Boyce* reference further teaches that “[t]he preparser 112 performs several data reduction operations on a HDTV bitstream as required to insure that the processing capacity of the SP and VLD circuit 120 and *throughout capability of the coded data buffer 116 are not exceeded* By reducing the data rate as required, the preparser 112 also *serves to reduce the coded data buffer size requirements because the coded data buffer 116 need only be capable of storing a reduced amount of data.*” *Id.*, col. 6, lines 27-38 (emphasis added).

The only reference to motion vectors during the decoding process in the *Boyce* reference discloses that “[t]he preparser 112 parses the incoming bitstream, without performing a complete variable length decode operation, . . . *to identify* MPEG coding elements such as macroblocks including motion vectors and DCT coefficients associated with each of the identified frames in the received data stream.” *Id.*, col. 6, lines 17-26. This passage provides only that the motion vectors are *identified* by the preparser 112 and does not indicate that the motion vectors are stored by the preparser 112 in the coded data buffer 116. The Appellant submits that the preparser 112 presumably identifies the MPEG coding elements, including the motion vectors, for the purpose of discarding the MPEG coding elements, as would be consistent with the stated

purposes of the preparser 112 to reduce the data rate, to “reduce the coded data buffer size requirements,” and to “selectively [discard] some of the received HDTV data.”

Moreover, the *Boyce* reference teaches that the “downsampled frames supplied by the frame buffer 118 to the MCP circuit 130 are upsampled . . . , interpolated and then downsampled prior to generating predictions based on the motion vectors. In this manner the motion vectors which were originally generated based on the full resolution video frames are effectively applied to downsampled video frames.” *Id.*, col. 11, lines 58-65. Thus, the *Boyce* reference teaches motion estimation by upsampling and interpolation, thereby rendering the original motion vectors redundant. The storage of redundant or unused information, such as the original motion vectors, in the coded data buffer 116 would only result in needlessly occupying space in the coded data buffer 116, and thus, the storage of the original motion vectors in the coded data buffer 116 by the preparser 112 would be contrary to the teachings of the *Boyce* reference as the above-identified passages of the *Boyce* reference teach that the purpose of the preparser 112 is to reduce the data rate of the incoming bit stream and to maintain the coded data buffer 116 within its limits.

Even if, *arguendo*, the *Boyce* reference disclosed the storage of the motion vectors in the coded data buffer 116, it will be appreciated that the coded data buffer 116 is coupled to the input of the purported video decoder of Figure 2A of the *Boyce* reference, so the purported video decoder cannot “provide the first motion vectors” as recited by claim 1. Instead, the purported video decoder only receives data from the coded data buffer 116.

Claim 11 recites, in part, the similar limitations of storing a plurality of first motion vectors. As the *Boyce* reference fails to disclose or suggest a first memory to store motion vectors as discussed above, the *Boyce* reference necessarily fails to disclose or suggest the

storage of a plurality of first motion vectors. In view of the foregoing, the Appellant submits that the Final Action fails to establish that the *Boyce* reference discloses or suggests the limitations of a first memory operably coupled to a video decoder to store first motion vectors as recited by claim 1 and the limitations of storing a plurality of motion vectors as recited by claim 11.

2) The *Takahashi* reference Fails to Disclose Storing Motion Vectors

The Final Action relies on *Takahashi* as purportedly disclosing an encoder coupled to a scaler and a first memory (allegedly element 26 of Figure 2C) “to provide a compressed representation of the scale video using first motion vectors” and cites the passage at col. 9, lines 23-44 of the *Takahashi* reference in support of this assertion. However, this passage states that “the side information obtained during data decoding, including . . . motion vector information, is applied to the scaling circuit 29 whereby the information is scaled and used for coding.” *Takahashi*, col. 9, lines 27-31. As Figures 2B and 2C of *Takahashi* (reproduced below) illustrate, this “side information” is provided directly from the variable length decoder 11 to the scaling circuit 29.

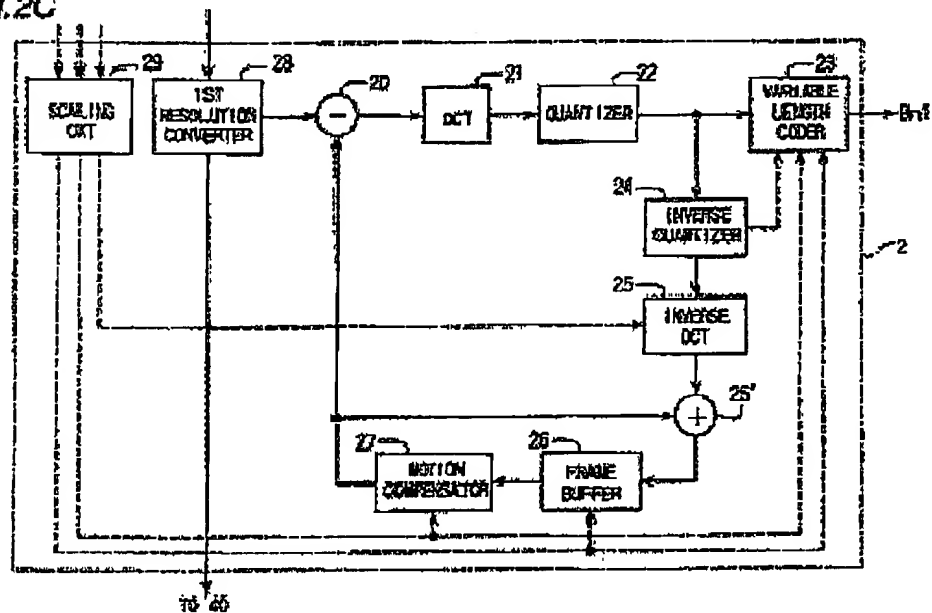

The *Takahashi* reference neither discloses nor suggests that this side information is stored in memory between the variable length decoder 11 and the scaling circuit 29. Accordingly, the *Takahashi* reference neither discloses nor suggests the limitations of a first memory coupled to store first motion vectors from a video decoder as recited by claim 1 or the limitations of storing a plurality of motion vectors and generating one or more second motion vectors based on the stored plurality of first motion vectors as recited by claim 11.

Fig.2B

The Takahashi Reference, Figure 2B

Fig. 2C

The Takahashi Reference, Figure 2C

3) The Proposed Combination of the *Boyce* and *Takahashi* References Does Not Disclose or Suggest Each and Every Limitation of the Claims Under Appeal

As noted above, neither the *Boyce* reference nor the *Takahashi* reference discloses or suggests the limitations of a first memory coupled to store motion vectors provided by a video decoder as recited in claim 1 or the limitations of storing a plurality of motion vectors and generating one or more second motion vectors based on the stored plurality of first motion vectors as recited by claim 11. The Appellant submits that the combination of the *Boyce* reference and the *Takahashi* reference as proposed in the Final Action consequently fails to disclose or suggest at least these limitations. As such, the proposed combination of the *Boyce* reference and the *Takahashi* reference fails to disclose or suggest each and every limitation of claims 1 and 11 and the Final Action therefore has failed to establish that the proposed combination of the *Boyce* reference and the *Takahashi* reference discloses or suggests each and every claim depending from claims 1 or 11 at least by virtue of this dependency.

4) There is No Motivation to Combine the *Boyce* and *Takahashi* references

The Appellant respectfully submits that not only do the *Boyce* and *Takahashi* references fail to disclose or suggest each and every limitation of the claims under appeal, neither the *Boyce* and *Takahashi* references nor the knowledge of one of ordinary skill in the art provide any motivation for the combination of the *Boyce* and *Takahashi* references as suggested by the Final Action. In fact, the proposed combination of the *Boyce* and *Takahashi* references is contrary to the goals of both the *Boyce* reference and the *Takahashi* reference.

The Appellant submits that the nature of the problems solved by the *Boyce* reference and the *Takahashi* reference are different and no suggestion or motivation to combine the references therefore is provided. Specifically, the *Boyce* reference identifies reducing memory in decoders

as a problem to be resolved in obtaining a low-cost decoder. *See Boyce*, col. 2, lines 1-25. The *Takahashi* reference focuses on the problem of maintaining high-quality images transmitted by a television broadcast station, such as high-definition television (HDTV) video. *See Takahashi*, col. 3, line 34 *et seq.* The Final Action states that one of ordinary skill "having the *Boyce et al* and *Takahashi et al* references in front of him/her and the general knowledge of video transcoders, would have had no difficulty in providing" the recited invention. *Final Action*, p. 6. The Final Action, however, provides no extrinsic evidence in support of this broad assertion. Given the different nature of the problems being solved, absent some other showing, there is no motivation for an inventor to have the references in front of them, let alone to combine them.

Moreover, not only is there an absence of a suggestion to combine the *Boyce* and *Takahashi* references, such a combination would destroy the purpose of the invention of the *Boyce* reference. Specifically, the *Boyce* reference is directed to a decoder having a reduced size memory buffer to provide a low cost decoder that is not capable of providing an HDTV picture quality. *See Boyce*, col. 4, line 31 *et seq.* The *Takahashi* reference discloses a system with two encoders that require HDTV quality be maintained. *Takahashi*, col. 7, line 63 *et seq.* The combination of the teachings of the *Takahashi* reference, which seeks to attain HDTV or near-HDTV quality, with the teachings of the *Boyce* reference prohibits the implementation of cost saving features required in the *Boyce* reference, such as reduced memory size.

The proposed combination of the *Boyce* and *Takahashi* references further destroys the purpose of the invention of the *Takahashi* reference as the *Boyce* reference discloses reducing the resolution of received high-definition (HD) pictures prior to decoding, thereby reducing the complexity of later processing stages of the decoder. In contrast, the *Takahashi* reference requires maintaining full HDTV video decoding quality. *See, e.g., Takahashi*, the output to 28

in FIG. 2B and output to 40 in FIG. 2C. The data reduction of the *Boyce* reference prior to decoding destroys the ability of the *Takahashi* reference to maintain full HDTV video as is explicitly sought by the *Takashi* reference.

5) The Final Action Fails to Establish a Valid § 103 Rejection of Claims 1-4, 6, 10-13, 60, 62, 63, 67 and 68

As established in sections 1-4 above, the proposed combination of the *Boyce* and *Takahashi* references fails to disclose each and every limitation of claims 1 and 11. Moreover, even if the proposed combination of the *Boyce* and *Takahashi* references did disclose every limitation, there is no motivation to combine these references found in the references themselves or in the knowledge of one of ordinary skill in the art. In fact, such a combination would destroy the purpose of the *Boyce* reference and the *Takahashi* reference due to their incompatible goals. Accordingly, the Appellant respectfully submits that the Final Action fails to establish a *prima facie* case of obviousness in support of its rejection of claims 1-4, 6, 10-13, 60, 62, 63, 67 and 68.

B. Rejection of Claims 7, 8, 15, 17, 19 and 20 under 35 U.S.C. § 103 (37 C.F.R. §1.192(c)(8)(iv)):

In Section 6 of the Final Action, claims 7, 8, 15, 17, 19 and 20 were rejected under 35 U.S.C. § 103(a) as unpatentable over the *Boyce* reference in view of the *Takahashi* reference and further in view of the *Yin* reference. Claims 7 and 8 depend from claim 1 and claims 15, 17, 19 and 20 depend from claim 11. As discussed above with respect to claims 1 and 11, there is no motivation to combine the *Boyce* and *Takahashi* references, and even if combined, the proposed combination of the *Boyce* and *Takahashi* references fails to disclose or suggest each and every limitation of claims 1 and 11. The *Yin* reference does not disclose or suggest any of the limitations of claims 1 and 11, nor does the Final Action or the Advisory Action assert that the *Yin* reference teaches any of these limitations. Accordingly, the proposed combination of the

Boyce, Takahashi and *Yin* references fails to disclose or suggest each and every limitation recited by claims 7, 8, 15, 17, 19 and 20 at least by virtue of their dependency from one of claims 1 or 11. The Final Action therefore fails to establish a *prima facie* case of obviousness in support of its rejection of claims 7, 8, 15, 17, 19 and 20.

C. Rejection of Claims 9, 16 and 18 under 35 U.S.C. § 103 (37 C.F.R. §1.192(c)(8)(iv)):

In Section 7 of the Final Action, claims 9, 16 and 18 were rejected under 35 U.S.C. § 103(a) as unpatentable over the *Boyce* reference in view of the *Takahashi* reference and further in view of the *Samad* reference. Claim 9 depends from claim 1 and claims 16 and 18 depend from claim 11. As discussed above with respect to claims 1 and 11, there is no motivation to combine the *Boyce* and *Takahashi* references, and even if combined, the proposed combination of the *Boyce* and *Takahashi* references fails to disclose or suggest each and every limitation of claims 1 and 11. The *Samad* reference does not disclose or suggest any of the limitations of claims 1 and 11, nor does the Final Action or the Advisory Action assert that the *Samad* reference teaches any of these limitations. Accordingly, the proposed combination of the *Boyce, Takahashi* and *Samad* references fails to disclose or suggest each and every limitation recited by claims 9, 16 and 18 at least by virtue of their dependency from one of claims 1 or 11. The Final Action therefore fails to establish a *prima facie* case of obviousness in support of its rejection of claims 9, 16 and 18.

D. Rejection of Claims 57, 58, 64 and 65 under 35 U.S.C. § 103 (37 C.F.R. §1.192(c)(8)(iv)):

In Section 8 of the Final Action, claims 57, 58, 64 and 65 were rejected under 35 U.S.C. § 103(a) as unpatentable over the *Boyce* reference in view of the *Takahashi* reference and further

in view of the *Vainsencher* reference. Claim 57, which depends from claim 1, and Claim 64, which depends from claim 11, are reproduced below for ease of reference:

57. (Previously Presented) The system of claim 1, wherein the first memory comprises a hard drive.

64. (Previously Presented) The system of claim 11, wherein the storing the first motion vectors includes storing the first motion vectors on a hard drive.

The Final Action asserts that the proposed combination of the *Boyce* reference, the *Takahashi* reference and the *Vainsencher* reference discloses the recited invention of claims 57, 58, 64 and 65. The Appellant disagrees and submits that the proposed combination of the *Boyce*, *Takahashi* and *Vainsencher* references fails to disclose or suggest each and every limitation recited by claims 1 and 11, from which claims 57, 58, 64 and 65 depend, respectively. This proposed combination also fails to disclose or suggest each and every additional limitation recited in claims 57, 58, 64 and 65. Additionally, the Appellant submits that there is no motivation to combine the *Boyce* reference, the *Takahashi* reference and the *Vainsencher* reference as proposed in the Final Action.

1) The *Vainsencher* Reference Fails to Disclose or Suggest Storing Motion Vectors in a Hard Drive

As noted above, claim 1, from which claim 57 depends, recites, in part, the limitations of a first memory coupled to a video decoder to store first motion vectors from a video input stream received at the video decoder and coupled to an encoder which uses the first motion vectors saved in the first memory to provide a compressed representation of scaled video. Claim 57 recites the additional limitations of wherein the first memory comprises a hard drive. As also noted above, claim 11 recites, in part, the limitations of storing a plurality of first motion vectors

associated with a compressed first video image and generating one or more second motion vectors based on the stored plurality of first motion vectors. Claim 64, which depends from claim 11, recites the additional limitations of wherein storing the first motion vectors includes storing the first motion vectors on a hard drive.

The Final Action relies on the *Boyce* reference and the *Takahashi* reference as purportedly disclosing the limitations of claims 1 and 11, from which claims 57 and 64 depend, respectively, and relies on the *Vainsencher* reference as allegedly disclosing the additional limitations recited by claims 57 and 64. Specifically, the Final Action asserts that “Vainsencher discloses a system for performing motion compensation as shown in Figures 1-3, and teaches the conventional use of a memory (112 of Figure 3) coupled to a video decoder . . . to store all plurality [sic] of first motion vectors used to build a frame of the compressed video image.” *Final Action*, p. 10. The Final Action admits that the *Vainsencher* reference teaches that the memory is an SDRAM “and not a hard drive memory as claimed.” *Id.* Instead, the Final Action relies on the depiction of a hard drive 90 in Figure 2 of the *Vainsencher* reference and asserts that “[i]t is however considered obvious that such hard drive memory of Vainsencher [i.e., the hard drive 90 of Figure 2] may certainly be used for storing the motion vectors in place of the SDRAM memory.” *Id.* The Appellant disagrees and submits that the *Vainsencher* reference fails to disclose or even suggest the use of a hard drive as recited by claims 57 and 64.

The Appellant notes that the hard drive 90 of Figure 2 of the *Vainsencher* reference is referenced only a single time (at col. 6, lines 45-47), and this single reference discloses only that “[v]arious other components may be comprised in the computer system [60], such as video 88 and hard drive 90.” No passage of the *Vainsencher* reference discloses or suggests that motion vectors, or any other video data for that matter, may be stored in the hard drive 90. Nor would

such hard drive storage be necessary in the system of the *Vainsencher* reference as the *Vainsencher* reference provides a frame-store memory 112 (which the Final Action admits is not a hard drive) for the storage of motion vectors. Moreover, the system of the *Vainsencher* reference is directed to an "MPEG decoder [that] stores reference block data according to a novel skewed tile arrangement to minimize the maximum number of page crossings required in retrieving this data from the memory." *Vainsencher*, Abstract. As will be appreciated by one of ordinary skill in the art, page crossings are specific to random access memory, such as SDRAM, and are not applicable to hard drives.

Moreover, the *Vainsencher* reference discloses that "[a] new system and method is further desired which provides guaranteed performance characteristics." *Id.*, col. 4, lines 34-35. As will be appreciated by one of ordinary skill in the art, the latency associated with a disk drive access is substantially greater (*i.e.*, often one, two or even more orders of magnitude) than the latency associated with a RAM access. Accordingly, the use of the hard drive 90 for the storage of motion vectors as proposed by the Final Action not only would be contrary to the goal of "guaranteed performance characteristics" sought by the *Vainsencher* reference but would also be contrary to conventional MPEG processing systems wherein RAM storage of video data is standard. Accordingly, the assertion in the Final Action that the use of a hard drive to store motion vectors is obvious solely based on the disclosure of a non-hard drive frame-store memory 112 in the *Vainsencher* reference may be attributed only to improper hindsight provided by the teachings of the present application.

2) There is No Motivation to Combine the Boyce, Takahashi and Vainsencher references.

Even if, *arguendo*, the *Vainsencher* reference suggested the use of a hard drive to store motion vectors as recited by claims 57 and 64 (which it does not), there would be no motivation to combine the *Boyce*, *Takahashi* and *Vainsencher* references as proposed by the Final Action. The systems of the *Boyce* and *Takahashi* references are directed to pipeline systems whereby video data is processed in real-time (or near real-time). As noted above, the use of a hard drive to store motion vectors would cause substantial delays due to the latency involved with access to the hard drive. Such substantial delays would be contrary to the pipeline operations of the systems of the *Boyce*, *Takahashi* and *Vainsencher* references and would frustrate their ability to operate at or near real-time. This incompatibility not only provides no motivation for one of ordinary skill in the art to combine the teachings of the *Boyce*, *Takahashi* and *Vainsencher* references as proposed by the Final Action, it provides a motivation for one in the ordinary skill in the art to avoid making such a combination.

3) The Final Action Fails to Establish a Valid § 103 Rejection of Claims 57, 58, 64 and 65

As established above, the proposed combination of the *Boyce*, *Takahashi* and *Vainsencher* references fails to disclose each and every limitation of claims 57, 58, 64 and 65. Moreover, even if this proposed combination did disclose every limitation, this proposed combination would be improper because there is no motivation to combine these references found in the references themselves or in the knowledge of one of ordinary skill in the art as the combination proposed by the Final Action would frustrate the goals of the references. Accordingly, the Appellant respectfully submits that the Final Action fails to establish a *prima facie* case of obviousness in support of its rejection of claims 57, 58, 64 and 65.

E. Rejection of Claim 61 under 35 U.S.C. § 103 (37 C.F.R. §1.192(c)(8)(iv)):

In Section 9 of the Final Action, claim 9 was rejected under 35 U.S.C. § 103(a) as unpatentable over the *Boyce* reference in view of the *Takahashi* reference and further in view of the *Mogeat* reference. Claim 61 depends from claim 1. As discussed above with respect to claim 1, there is no motivation to combine the *Boyce* and *Takahashi* references, and even if combined, the proposed combination of the *Boyce* and *Takahashi* references fails to disclose or suggest each and every limitation of claim 1. The *Mogeat* reference does not disclose or suggest any of the limitations of claim 1, nor does the Final Action or the Advisory Action assert that the *Mogeat* reference teaches any of these limitations. Accordingly, the proposed combination of the *Boyce*, *Takahashi* and *Mogeat* references fails to disclose or suggest each and every limitation recited by claim 61 at least by virtue of its dependency from claim 1. The Final Action therefore fails to establish a *prima facie* case of obviousness in support of its rejection of claim 61.

F. Rejection of Claim 10 under 35 U.S.C. § 112 (37 C.F.R. §1.192(c)(8)(iv)):

In Section 3 of the Final Action, claim 10 was rejected under 35 U.S.C. Section § 112, second paragraph, as being indefinite. Specifically, the Final Action asserts that because claim 10 claims an MPEG data input stream, claim 10 is allegedly indefinite "because there are many versions of the MPEG recommendations and the recommendations are continuously updated. The scope of the claim limitations cannot change over time, and unless the applicant provides in the remarks section of a response to [the Final Action] stating the specific MPEG version with the date or a copy of the MPEG recommendation is provided, the claim is considered indefinite." *Final Action*, p. 3. In response to this rejection, the Appellant provided the following statement in the numerous responses: "to the extent necessary, the recitation of MPEG should be limited to

those variations of MPEG known at the time of filing. . . The Office is requested to reconsider its position that one of ordinary skill in the art could readily determined that specific MPEG recommendation versions with a data based on the filing date of the present application." *See Response to Final Action*, p. 12.

The Appellant submits that this statement is sufficient to particularly point out and define which MPEG recommendations are applicable in view of claim 10. The indefinite rejection of claim 10 therefore should be withdrawn.

VIII. CONCLUSION

For the reasons given above, the Appellant respectfully requests reconsideration and allowance of all claims and that this patent application be passed to issue.

Respectfully submitted,

30 August 2006

IX. APPENDIX OF CLAIMS INVOLVED IN THE APPEAL (37 C.F.R. § 41.37(c)(1)(viii))

The text of each claim involved in the appeal is as follows:

1. (Previously Presented) A system comprising:
 - a video decoder to receive a video input stream having one or more first motion vectors, the video decoder to provide decoded video and the first motion vectors associated with the video input stream;
 - a first memory coupled to the video decoder to store the first motion vectors;
 - a scaler coupled to receive the decoded video and to provide a scaled video; and
 - an encoder coupled to the scaler and the first memory to provide a compressed representation of the scaled video using the first motion vectors saved in the first memory.
2. (Original) The system of claim 1 further comprising:
 - a second memory coupled to the video decoder to store a representation of the decoded video.
3. (Original) The system of claim 2, wherein the representation of the decoded video is the decoded video.
4. (Original) The system of claim 2, wherein the scaler is a down-scaler.
6. (Original) The system of claim 1, wherein the video encoder has a vector generation portion that provides second motion vectors based on the first motion vectors saved in the first memory.
7. (Original) The system of claim 6, wherein a specific vector of the second motion vectors is based on a plurality of vectors of the first motion vectors.
8. (Original) The system of claim 6, wherein a specific vector of the second motion vectors is based on an average of at least two vectors of the first motion vectors.

9. (Original) The system of claim 6, wherein a specific vector of the second motion vectors is based on a most frequently occurring vector of the first motion vectors.
10. (Original) The system of claim 6, wherein the video input is an MPEG data input stream.
11. (Previously Presented) A method comprising:
 - determining a plurality of first motion vectors associated with a compressed first video image;
 - storing the plurality of first motion vectors (a stored plurality of first motion vectors);
 - generating one or more second motion vectors based on the stored plurality of first motion vectors; and
 - generating a compressed second video image based upon one or more second motion vectors, wherein the second video image is a scaled representation of the first video image.
12. (Previously Presented) The method of claim 11 further comprising:
 - storing a representation of the first video image after determining; and
 - wherein generating a compressed second video image includes generating the compressed second video image based on the one or more second motion vectors and a second video image, wherein the second video image is a representation of the first video image.
13. (Original) The method of claim 12, wherein the scaled representation is a scaled-down representation.
15. (Previously Presented) The method of claim 12, wherein generating the one or more second motion vectors includes averaging at least a portion of the plurality of first motion vectors to represent a vector in the one or more second motion vectors.
16. (Previously Presented) The method of claim 12, wherein generating the one or more second motion vectors includes selecting a most frequently occurring vector in a portion of the plurality of first motion vectors to represent a vector in the one or more second motion vectors.

17. (Previously Presented) The method of claim 11, wherein generating the one or more second motion vectors includes averaging at least a portion of the plurality of first motion vectors to represent a vector in the one or more second motion vectors.
18. (Previously Amended) The method of claim 11, wherein generating the one or more second motion vectors includes selecting a most frequently occurring vector in a portion of the plurality of first motion vectors to represent a vector in one or more of second motion vectors.
19. (Original) The method of claim 11, wherein a number of vectors in the one or more second motion vectors that represents the second video image is different than a number of vectors in the plurality of first motion vectors that represent the first video image, and wherein the second video image is a representation of the first video image.
20. (Original) The method of claim 19, wherein the number of vectors in the one or more second motion vectors is less than the number of vectors in the plurality of first motion vectors.
58. (Previously Presented) The system of claim 1, wherein the first memory coupled to the video decoder is to store all motion vectors used to build a frame of the video input stream.
60. (Previously Presented) The system of claim 1, wherein the system further comprises a scaling input to indicate an amount of scaling to be implemented by the scaler.
61. (Previously Presented) The system of claim 1, wherein:
the video decoder is to receive the video input stream having a first set of motion vectors representing a first frame of video, where the one or more first motion vectors being at least a portion of the first set of motion vectors, and a second set of motion vectors representing a second frame of video;
and
the first memory coupled to the video decoder to simultaneously store the first set of motion vectors and the second set of motion vectors.
63. (Previously Presented) The system of claim 1, wherein the decoder and encoder are part of a transcoder processor.

64. (Previously Presented) The system of claim 11, wherein the storing the first motion vectors includes storing the first motion vectors on a hard drive.
65. (Previously Presented) The method of claim 11, wherein the plurality of first motion vectors include all motion vectors used to build a frame of the compressed first video image.
67. (Previously Presented) The method of claim 11, further comprising receiving a scaling indicator to indicate an amount of scaling to be applied to the compressed second video image.
68. (Previously Presented) The method of claim 11, wherein storing the plurality of first motion vectors further storing the plurality of first motion vectors in response to a mode indicator being in a first state.
